

Product Highlights

Top-notch Training

- GoSaaS also trains the customer on how to modify certain configuration aspects based on the original GoStart settings
- Self-paced training is provided along with on-going access to a training portal with continuously updated videos

GoStart (enterprise edition) are best practices industry templates developed by GoSaaS to speed up the cloud implementation process. GoSaaS provides a predefined application configuration that can be loaded quickly into the customer's cloud environment.

Features

- GoStart brings together the details for Item Classes, Change Orders (attributes and workflows), BOM details and Manufacturer details for the configuration in Oracle PLM Cloud
- The security structure is also laid out in GoStart so that the roles and privileges can be assigned to the users accordingly
 - A combination of Create, Read, Update and Delete features can be used to form Job roles allowing them to perform certain actions
 - The job roles can be micromanaged and the security features can be implemented to the item class level. This granularity in security allows admin control on the system
- The workflow of the Change Order has to be specified and the details for auto-promotion/demotion and approver options can be listed for a best-fit solution

GoSaaS' best-practices configuration baseline for the following:

- Auto-numbering for Parts and Documents
- Part and Document Classes with attributes
- Workflows and Workflow Status
- User Roles and Privileges
- Configuration documentation

Example of subclasses

Benefits

- Predefined application configuration with rich subclass definitions present
- Saves many hours of work researching, defining, and configuring a sophisticated set of part and document subclasses with associated attributes
- Go-Live with the Oracle PLM Cloud solution will be much sooner
